In algebra, which is a broad division of mathematics, abstract algebra (occasionally called modern algebra) is the study of algebraic structures.Algebraic structures include groups, rings, fields, modules, vector spaces, lattices, and algebras.The term abstract algebra was coined in the early 20th century to distinguish this area of study from the other parts of algebra.

The central idea behind abstract algebra is to de?ne a larger class of objects (sets with extra structure), of which  $\mathbb{Z}$  and  $\mathbb{Q}$  are de?nitive members.  $(\mathbb{Z}, +)$  ?? Groups  $(\mathbb{Z}, +, \times)$  ?? Rings  $(\mathbb{Q}, +, \times)$  ?? Fields In linear algebra the analogous idea is  $(\mathbb{R}^n, +, \text{scalar multiplication})$  ?? Vector Spaces over  $\mathbb{R}$

Introduction to Abstract Algebra (Math 113)

Abstract algebra is a broad field of mathematics, concerned with algebraic structures such as groups, rings, vector spaces, and algebras. Roughly speaking, abstract algebra is the study of what happens when certain properties of number systems are abstracted out; for instance, altering the definitions of the basic arithmetic operations result in a structure known as a ring, so long as the operations are consistent.

Abstract Algebra | Brilliant Math & Science Wiki

Abstract algebra is the set of advanced topics of algebra that deal with abstract algebraic structures rather than the usual number systems. The most important of these structures are groups, rings, and fields. Important branches of abstract algebra are commutative algebra, representation theory, and homological algebra.

In mathematics and abstract algebra, group theory studies the algebraic structures known as groups.The concept of a group is central to abstract algebra: other well-known algebraic structures, such as rings, fields, and vector spaces, can all be seen as groups endowed with additional operations and axioms.Groups recur throughout mathematics, and the methods of group theory have influenced many ...

Abstract algebra came into existence largely because mathematicians were unable to solve classical (pre-nineteenth-century) problems by classical means. The classical problems came from number theory, geometry, analysis, the solvability of polynomial equations, and the investigation of properties of various number systems.
