Introduction to Acids and Bases. Acids and bases play a central role in chemistry because, with the exception of redox reactions, every chemical reaction can be classified as an acid-base reaction. Our understanding of chemical reactions as acid-base interactions comes from the wide acceptance of the Lewis definition of acids and bases, which supplanted both the earlier Bronsted-Lowry concept and the first definition--the Arrhenius model.

Just as an acid is a substance that liberates hydrogen ions into solution, a baseyields hydroxide ions when dissolved in water: NaOH (s) □ Na + (aq) + OH □ (aq) Sodium hydroxide is an Arrhenius base because it contains hydroxide ions. However, other substances which do not contain hydroxide ions can nevertheless produce them by reaction with water, and are therefore also classified as bases.

Introduction to Acids and Bases Perhaps no two classes of compounds are more important in chemistry than acids and bases. All acids have several properties in common: They have a sour taste, and they all react with most metals to form hydrogen gas (H 2) and with baking soda to form carbon dioxide (CO 2).

Along with water, the principal substances of your muscles, organs, blood, and skin are proteins - polymers of amino acids joined by acid-base reactions. Your genetic makeup is found in the DNA (deoxyribonucleic acid) in the nuclei of your cells. Acid-base chemistry is literally all around you! There are two ways acids and bases can be described.

acids and bases are substances that are capable of splitting off or taking up hydrogen ions, respectively." The Brønsted-Lowry definition broadened the Arrhenius concept of acids and bases. The Brønsted-Lowry definition of acids is very similar to the Arrhenius definition: Any substance that can donate a hydrogen ion is an acid.

The number of these hydrogen ions that can be replaced in an acid is the basicity of an acid. Monobasic Acid: A monobasic acid is an acid which has only one hydrogen ion. Therefore, these acids combine with one hydroxyl group of the base to form salt and water. For e.g. HCl, HCOOH, HBr, etc
