Decoding Protein Synthesis – Instructions. Cells use a multistep process to make the proteins that they need. The thesis stating that information flows from DNA to RNA to protein is called Central Dogma. The DNA serves as the instructions for making the protein, and RNA is also critically important to carrying out the process of protein synthesis. The process is divided into two main parts:

SYNOPSIS. This activity uses the metaphor of decoding a secret message for the Protein Synthesis process. Students teach themselves the sequence of DNA-Translation (DNA-mRNA-tRNA protein), and practice with DNA codes which translate into amino acid sequences spelling out meaningful sentences in English! This activity provides practice in base-pair matching and following the sequence as performed by cells.

Decoding DNA. For years, the exact means by which the DNA coded for structures, chemicals and other behaviors in living things was a mystery. Scientists now know which mRNA codons match each amino acid. This means that if you know the sequence of DNA or mRNA, you can figure out the sequence of amino acids that make a protein.

How protein degradation is controlled is a central question in biology. Christiano et al. provide a global analysis of protein turnover looking at some 120 Saccharomyces cerevisiae mutants. The power of this T-MAP approach is illustrated by the analysis of specific pathways governing, for instance, lipid metabolism pathways.
