Heating and Cooling Curves. In the Unit on Thermochemistry, the relation between the amount of heat absorbed or related by a substance,  $q$ , and its accompanying temperature change,  $\Delta T$ , was introduced: (8.1.1)  $q = m c \Delta T$ . where  $m$  is the mass of the substance and  $c$  is its specific heat. The relation applies to matter being heated or cooled, but not undergoing a change in state.

Heating curves show how the temperature changes as a substance is heated up. Cooling curves are the opposite. They show how the temperature changes as a substance is cooled down. Just like heating curves, cooling curves have horizontal flat parts where the state changes from gas to liquid, or from liquid to solid.

Heating Curves Imagine that you have a block of ice that is at a temperature of  $-30^{\circ}\text{C}$ , well below its melting point. The ice is in a closed container. As heat is steadily added to the ice block, the water molecules will begin to vibrate faster and faster as they absorb kinetic energy.

The heating curve for carbon dioxide would have only one plateau, at the sublimation temperature of  $\text{CO}_2$ . The entire experiment could be run in reverse. Steam above  $100^{\circ}\text{C}$  could be steadily cooled down to  $100^{\circ}\text{C}$ , at which point it would condense to liquid water.
