Abstract. In this paper, we apply a Hidden Markov Model (HMM) to analyze time-series personal health checkup data. HMM is widely used for data having continuation and extensibility such as time-series health checkup data. Therefore, using HMM as probabilistic model to model the health checkup data is considered to be suitable, and HMM can express the process of health condition changes of a person.

Hidden Markov Model (HMM) is a statistical Markov model in which the system being modeled is assumed to be a Markov process – call it – with unobservable ("hidden") states. HMM assumes that there is another process whose behavior "depends" on . The goal is to learn about by observing . HMM stipulates that, for each time instance , the conditional probability distribution of given the history ...

Gu é don and Langrock and Zucchini proposed a hidden semi-Markov model, which formulated the state dwell-time through a positive integer random variable and separately modeled the transition probability matrix of the embedded Markov chain, to allow irregular observation times. However, these approaches only enabled the modeling of discrete sequences with time going to infinity and did not investigate the asymptotic properties of parameter estimators.

A principal method for carrying out regime detection is to use a statistical time series technique known as a Hidden Markov Model. These models are well suited to the task as they involve inference on "hidden" generative processes via "noisy" indirect observations correlated to these processes.

Hidden Markov Models - An Introduction | QuantStart
Model We develop a continuous-time hidden Markov model to represent the processes that are acting on the system. The overall model is summarised in Fig. 1 in the form of a directed graph, providing the direct conditional relationships between the model parameters. We describe each of the components of the hierarchical model in turn.
